Principles of Computational Modelling in Neuroscience By David Sterratt, Bruce Graham, Dr Andrew Gillies, David Willshaw

The nervous system is made up of a large number of interacting elements. To understand how such a complex system functions requires the construction and analysis of computational models at many different levels. This book provides a step-by-step account of how to model the neuron and neural circuitry to understand the nervous system at all levels, from ion channels to networks. Starting with a simple model of the neuron as an electrical circuit, gradually more details are added to include the effects of neuronal morphology, synapses, ion channels and intracellular signaling. The principle of abstraction is explained through chapters on simplifying models, and how simplified models can be used in networks. This theme is continued in a final chapter on modeling the development of the nervous system. Requiring an elementary background in neuroscience and some high school mathematics, this textbook is an ideal basis for a course on computational neuroscience.

Editorial Review

Review

"Here at last is a book that is aware of my problem, as an experimental neuroscientist, in understanding the maths, the book helps me deal with it with the patience that the team always showed to students and professors alike. I expect it to be as mind expanding as my involvement with its authors was over the years. I only wish I had had the whole book sooner - then my students and post-docs would have been able to understand what I was trying to say and been able to derive the critical tests of the ideas that only the rigor of the mathematical formulation of them could have generated."

Gordon W. Arbuthnott, Okinawa Institute of Science and Technology

"This is a wonderful, clear and compelling text on mathematically-minded computational modelling in neuroscience. It is beautifully aimed at those engaged in capturing quantitatively, and thus simulating, complex neural phenomena at multiple spatial and temporal scales, from intracellular calcium dynamics and stochastic ion channels, through compartmental modelling, all the way to aspects of development. It takes particular care to define the processes, potential outputs and even some pitfalls of modelling; and can be recommended for containing the key lessons and pointers for people seeking to build their own computational models. By eschewing issues of coding and information processing, it largely hews to concrete biological data, and it nicely avoids sacrificing depth for breadth. It is very suitably pitched as a Master's level text, and its two appendices, on mathematical methods and software resources, will rapidly become dog-eared."

Peter Dayan, University College London

"This book has done a nice job of laying out their strategy or covering major topics in the field of computational neuroscience while maintaining a well-organized structure. It is prepared for both expert and non-expert readers with an elementary background in neuroscience and some high school mathematics. This is a timely, well-written book that provides a comprehensive, in-depth and state-of-the-art coverage of computational modeling in neuroscience. It can serve as an excellent text for a graduate level course in computational neuroscience, as well as a valuable reference for experimental neuroscientists, computational neuroscientists and people working in relevant areas such as neuroinformatics and systems biology."

Li Shen, Briefings in Bioinformatics

About the Author

David Sterratt is a Research Fellow in the School of Informatics at the University of Edinburgh. His computational neuroscience research interests include models of learning and forgetting, and the formation of connections within the developing nervous system.

Bruce Graham is a Reader in Computing Science in the Department of Computing Science and Mathematics at the University of Stirling. Focusing on computational neuroscience, his research covers nervous system modelling at many levels.

Andrew Gillies works at Psymetrix Limited, Edinburgh. He has been actively involved in computational neuroscience research.

David Willshaw is Professor of Computational Neurobiology in the School of Informatics at the University of Edinburgh. His research focuses on the application of methods of computational neurobiology to an

understanding of the development and functioning of the nervous system.

Users Review

From reader reviews:

Anthony Pippin:

Have you spare time for a day? What do you do when you have far more or little spare time? Yeah, you can choose the suitable activity intended for spend your time. Any person spent their spare time to take a walk, shopping, or went to the particular Mall. How about open or maybe read a book titled Principles of Computational Modelling in Neuroscience? Maybe it is to become best activity for you. You understand beside you can spend your time together with your favorite's book, you can cleverer than before. Do you agree with the opinion or you have other opinion?

Raymond Hollander:

Exactly why? Because this Principles of Computational Modelling in Neuroscience is an unordinary book that the inside of the book waiting for you to snap that but latter it will shock you with the secret the item inside. Reading this book close to it was fantastic author who have write the book in such wonderful way makes the content interior easier to understand, entertaining way but still convey the meaning totally. So , it is good for you because of not hesitating having this any more or you going to regret it. This amazing book will give you a lot of positive aspects than the other book get such as help improving your proficiency and your critical thinking means. So , still want to hesitate having that book? If I were being you I will go to the book store hurriedly.

Victor Parisi:

In this period globalization it is important to someone to find information. The information will make you to definitely understand the condition of the world. The health of the world makes the information easier to share. You can find a lot of references to get information example: internet, paper, book, and soon. You will observe that now, a lot of publisher in which print many kinds of book. The particular book that recommended to you is Principles of Computational Modelling in Neuroscience this publication consist a lot of the information of the condition of this world now. This kind of book was represented how can the world has grown up. The words styles that writer use to explain it is easy to understand. The writer made some research when he makes this book. Here is why this book suitable all of you.

Elizabeth Smith:

Don't be worry if you are afraid that this book will certainly filled the space in your house, you can have it in e-book technique, more simple and reachable. This Principles of Computational Modelling in Neuroscience can give you a lot of good friends because by you taking a look at this one book you have thing that they don't and make a person more like an interesting person. That book can be one of a step for you to get success. This e-book offer you information that possibly your friend doesn't understand, by knowing more than different make you to be great folks. So , why hesitate? Let's have Principles of Computational

Modelling in Neuroscience.
